NAME: DHRITI SHUKLA

REG NO: 25BAI10259

BRANCH: BTECH AIML

YEAR 2025-26

COURSE CODE: CSE0001

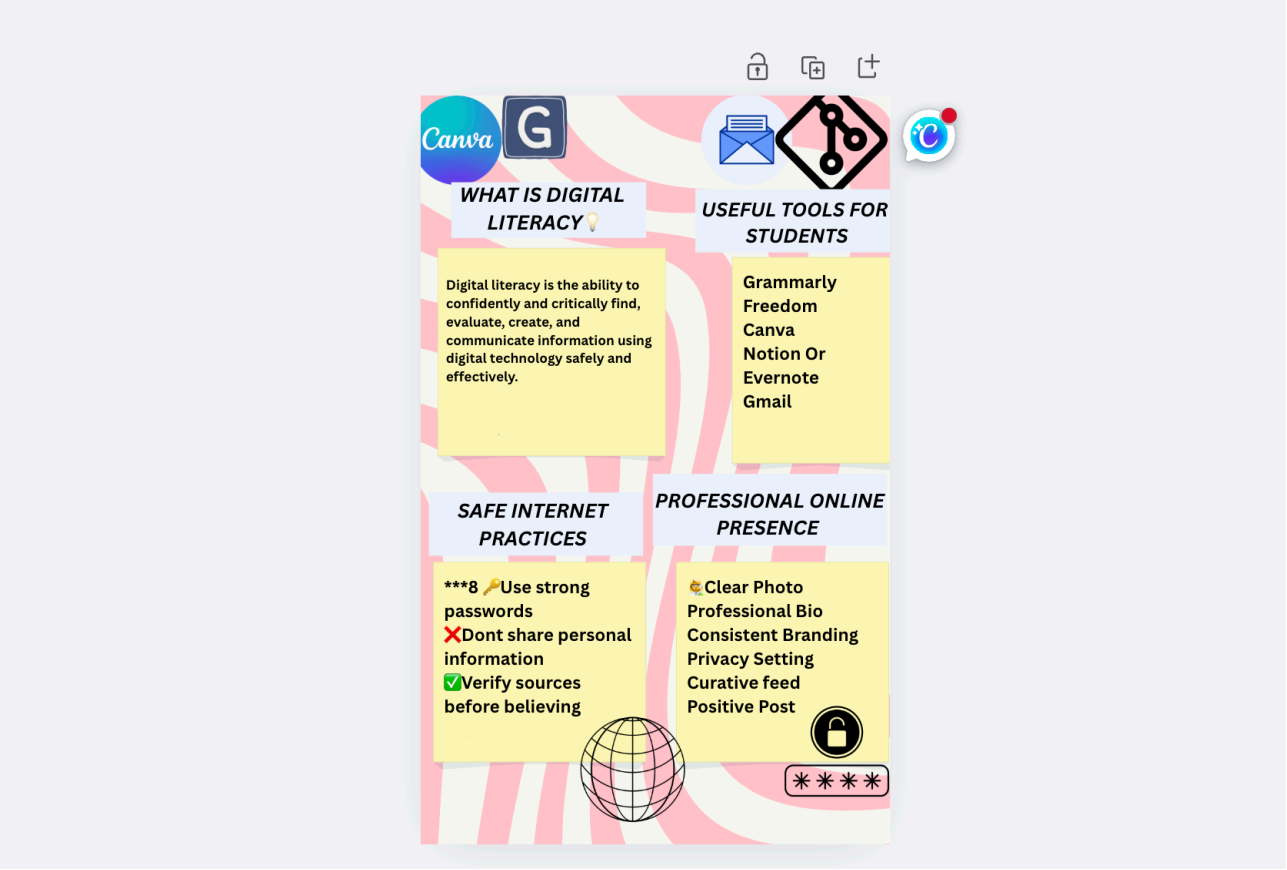
DATE: 29/03/26

INTRODUCTION

This digital literacy project aims to bridge the technological divide by empowering underserved communities with the essential skills needed to navigate today’s hyper-connected world. The initiative focuses on transforming "passive consumers" into "active digital citizens" by providing structured training on hardware basics, internet safety, and e-governance services. By establishing community-based digital labs, the project ensures that individuals—particularly rural students, women, and marginalized workers—gain the confidence to use smartphones and computers for personal and professional growth.

In a typical implementation scenario, the project targets an "internet-dark" region where a lack of technical knowledge prevents residents from accessing vital online resources. The intervention involves a phased curriculum that moves from basic device operations to more complex tasks like digital payments, online job applications, and verifying information to combat "fake news." Ultimately, the scenario envisions a shift where at least one member of every household is digitally literate, fostering a sustainable culture of self-reliance. By integrating these tools into daily life, the project not only enhances individual employability but also ensures that no one is left behind as essential public services transition to digital-first platforms.

TASK1 Infographic:



In this project, I created a digital poster on **Digital Literacy** using **Canva**. I picked Canva because it's really easy to use and has so many beautiful templates and icons. I didn't need to be a pro designer – I could just drag and drop things until it looked nice.

The poster explains what digital literacy is and how students can use the internet more smartly. It has four main parts: a simple definition of digital literacy, a list of helpful tools like Grammarly, Notion, Canva, and Gmail, safe internet practices (like creating strong passwords, not sharing personal info, and checking sources before believing them), and tips for building a good professional online presence.

What I found most interesting while making it was realising how much a clean layout and colours can make boring information actually fun to read. At first, the text looked too crowded, so I had to move things around many times. But when it finally came together, I felt really proud because it looked simple yet informative.

TASK2 Digital Portfolio:

In your project report, write 150–200 words on: which platforms you chose, what each one is used for, and how you plan to use them over the next four years.

During this project and my learning journey, I created profiles on three main platforms: GitHub, LinkedIn, and Stack Overflow.

I chose **GitHub** mainly to upload and showcase all my coding projects and repositories. It feels like my personal coding portfolio where I can keep everything organised and even collaborate with others. **LinkedIn** is my professional space – I use it to connect with people from the industry, share what I'm learning, and build my network for future internships or jobs. **Stack Overflow** has been super helpful whenever I get stuck while coding; it's the place where I ask questions and learn from experienced developers.

Over the next four years of college, I plan to stay active on all three. On GitHub, I want to regularly push my college assignments and small projects. On LinkedIn, I'll keep updating my profile and start posting about my progress. With Stack Overflow, I hope to move from just asking questions to actually answering some as I become more confident. These platforms are going to help me grow step by step.

TASK3 Platforms:

PART A Coding Practice:

For Coding Practice, I created my HackerRank account and started solving beginner-level challenges.HackerRank is a popular online platform where programmers, especially students and beginners, can practice coding skills through real challenges and problems. It has many users worldwide and is widely used for learning, improving problem-solving abilities, and preparing for technical interviews.

I completed some famous problems, which helped me understand the platform and get comfortable. You can see my profile that I have practiced various programs, which already shows the Python badge I earned.

Various Problems helped me improve my thinking capability. The loops, leap year ,etc questions were quite interesting.Working on loops, conditions, and basic Python concepts was quite enjoyable and helped me test my knowledge in a practical way. Basic coding/ problem-solving on HackerRank has helped me test my knowledge in Python. Setting up all these platforms and completing my first challenge made me realise how these tools can support my learning journey. I feel more confident now and plan to solve more problems regularly on HackerRank.

PART B Google Workspace Collaboration:

For this project, I primarily utilised google form n google docs to design and structure my communication scenario. My main focus was on building a "Digital Literacy Awareness Quiz," which involved researching cybersecurity best practices and translating them into clear, engaging questions for my batchmates. I practised designing different question formats—ranging from multiple-choice to short-answer responses—to ensure the data collected would be both measurable and insightful.
These tools are incredibly valuable for my academic journey. Mastering Google Forms allows me to conduct primary research and collect data for future assignments with ease. Furthermore, the process of creating this quiz strengthened my ability to synthesise complex information into concise digital content. Understanding how to navigate and secure digital platforms not only helps me collaborate more effectively on group projects

but also ensures that I can manage my online academic presence safely and professionally.

TASK4:

DO's: Building Oneself✅	Don'ts: Self-Sabotage❌
Audit your Privacy Setting: Regularly to control who sees your Personal posts.	**Post in the heat of the moment.**
Highlight your Achievements: Such as projects, Certificates, and volunteer work.	**Complaining about your employees,** boss or peers on any social media platform
Engage Industry Leaders: By sharing or commenting on relevant news in your field.	**Sharing sensitive info** like Home address, Phone no , Student IDetc.
Think Before Tag-ing anyone on social media: Respecting everyone's privacy.	**Post content showing illegal acts or** excessive partying that could deter recruiters.
Use Professional Profile Picture	**Plagiarise** or sharing work that isn't your without acknowledging the contributor.

A small business owner, Sarah, who nearly lost her catering company due to a simple digital misunderstanding. She received an email from a major client requesting a "final quote" for a massive wedding. Thinking they meant the final *version* of the document they already had, she replied with a quick "All set!" and an emoji. The client, however, was actually asking for a final *price negotiation* before signing. Because the email was vague and Sarah's response was overly casual, the client felt ignored and almost walked away, assuming Sarah wasn't taking the professional contract seriously.
This stressful situation could have been avoided with better digital etiquette and clarity. Instead of a cryptic three-word reply, Sarah should have used a clear subject line and summarized the specific costs in her message to confirm they were on the same page. On the other side, the client could have used bullet points to highlight exactly what information was missing. By slowing down and practicing active digital listening—asking "Does this message leave room for doubt?"—both parties could have saved days of frustration and protected their professional relationship.

TASK5 Cybercrime:

What surprised me most during this research was realizing how much of digital safety is about human psychology rather than just technical hacking. I always assumed I was too "tech-savvy" to be fooled, but learning how easily scammers use high-pressure tactics to trick people into entering a UPI PIN just to *receive* money was a huge wake-up call. It made me realize that even the smartest people can make mistakes when they are rushed or distracted.

As a result, the one habit I'm personally changing is my "click-first, think-later" approach to public Wi-Fi. I used to reflexively join any free network at a cafe or airport to save data without a second thought. Now that I understand how easily those open connections can be used to "sniff" out my banking or social media passwords, I've committed to staying on my mobile data for anything sensitive. It's a small, slightly less convenient step, but it feels worth it for the peace of mind.

CONCLUSION

This project has been a powerful reminder that digital literacy is no longer just a technical skill—it is a fundamental right. Beyond learning how to set passwords or use UPI, the most significant takeaway for me was realising how much confidence plays a role in technology. For many, the digital world feels like a minefield of potential mistakes; however, with the right guidance, that fear turns into a tool for independence.

I learned that being "tech-savvy" isn't about knowing every app, but about having the critical thinking to question a suspicious link or a high-pressure message. Seeing how a simple 20-minute lesson on online safety can protect a family's life savings made the impact of this project feel very real.

Moving forward, I've realised that digital literacy isn't a destination you reach, but a continuous habit of staying curious, cautious, and helpful to those who are still finding their way online.
